Workshop: Nuclear New Build 'Understanding the RCC-M nuclear code'

The UK is to build additional new nuclear power generation capacity, which is to be reliable, for its design lifetime and any lifetime extension; generating energy at competitive costs without producing any carbon dioxide.

NOF Energy in partnership with member company Geoff B Associates are hosting a nuclear new build workshop. The event will provide managers, engineers and technicians who have design, manufacturing, inspection, test or quality assurance and control responsibilities a greater understanding of the RCC-M technical codes and relationship with the equivalent ASME code.

The workshop includes:

- The scope and evolution of the RCC-M code
- The structure of the RCC-M code
- Interaction with Regulatory requirements
- Outline and structure of the RCC-E (Electrical requirements)
- Outline and structure of RSE-M (In-service inspection)
- A detailed comparison with ASME Section 3

Reasons to attend this workshop include:

- You will be supplying equipment for use in a nuclear context, goods are subject to a specific safety evaluation and demonstration process.
- RCC-M is a widely used and acknowledged technical code and tool for the manufacturing of nuclear equipment, to achieve quality.
- RCC-M uses regulatory oversight, technical qualification, current national and international standards.

Tier 2 companies may need a clear understanding of RCC-M, when specifying the quality requirements to their sub suppliers and contractors.

Tier 3 and 4 companies may require being familiar with the RCC-M code when understanding the project quality requirements.
